

Findings and recommendations to address the challenge.

The study found that conflict events are more strongly correlated with fatalities. This means that there is a high relationship between the number of events and number of fatalities. Hence a rise in the number of events will also give rise to the number of fatalities.

Based on the analysis, the following are my recommendations:

1. African governments should double efforts to mitigate conflict and reduce conflict events as these efforts are vital for the reduction in the number of fatalities. This will require huge investment in the peace and security architecture of the country to ensure that violent conflicts do not occur.
2. In the event of a violent conflict, efforts should be made to address the conflict as early as possible in order to reduce fatalities.
3. Governments and organizations should also make efforts to track the trends of conflict in Africa and identify the recurring root causes as well as the potential root causes of conflict in the future, and develop strategic and sustainable solutions to address them.
